LRT™ LiveU Reliable Transport

A video and audio delivery protocol developed over the past two decades by LiveU. LRT™ ensures rock-solid reliability over **cellular and other IP networks**.

LRT™ advantages

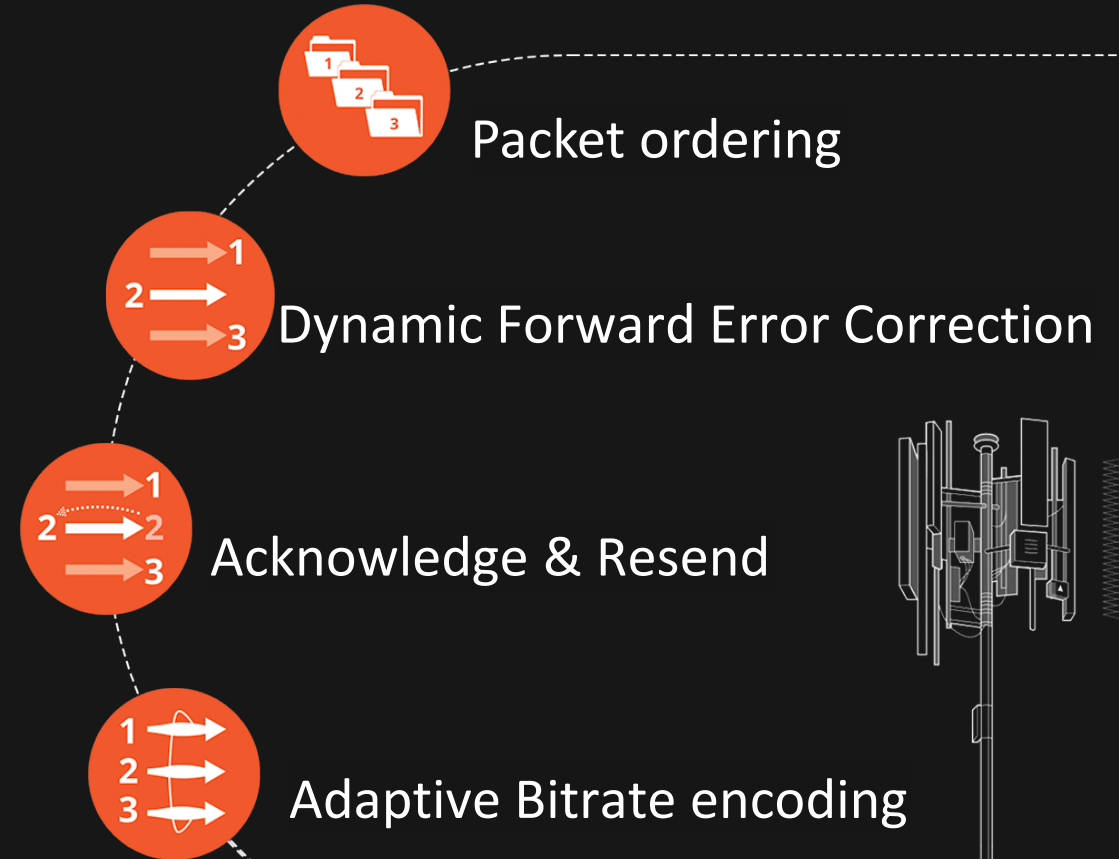

Dynamic network awareness

LRT™ continuously monitors network fluctuations and automatically compensates, maintaining a resilient live stream regardless of inevitable instability of network connections.

A tight protocol-encoder integration

Due to the unique integration between LRT™ and all LiveU encoders, as bandwidth changes, LRT™ dynamically adjusts the video encoder's bitrate, optimizing the stream for the available bandwidth.

This ensures that data isn't overloaded, minimizing buffering and maintaining the best possible stream quality.

IP Bonding – Bonds multiple network connections into a single virtual larger connection

Source
(Field)

Destination
(HQ / MCC / etc)

But... What happens when the network **bandwidth shrinks**?

Not all packet can go through, resulting in **disrupted video and freezes**

Source
(Field)

Destination
(HQ / MCC / etc)

LRT™ adapts the video stream to the available network bandwidth

Source
(Field)

Destination
(HQ / MCC / etc)

LRT™ adapts the video stream to the available network bandwidth making sure the video will be received with **no disruptions**

Source
(Field)

Destination
(HQ / MCC / etc)

... and it **continuously** does that

Real-time Reliable High-quality Video Transport and Distribution

Seamless video transport
from any video source

A **mobile solution** that works
everywhere with virtually any
type of network, bonding all of
them together

Mesh

Low latency transport to
any destination

Command & Control

Mobile Command Center

Portable devices

Interoperable with your
existing

The solution components

LiveU Situational Awareness Solution Components

LU-REQON1 – HIGHLIGHTS

Transmit Video from any RTSP or HDMI Source

Molle attachment portability

Molle attachment

IP Bonding links & LRT™

6 network links

- 2x4G internal modems
- 2x4G external modems
- 1 Ethernet
- 1 Wi-Fi

IP Bonding

Splitting encoded video over **multiple operators and technologies** together, at the same time.

- Cellular
- SATCOM (Ka/Ku, BGAN)
- Wi-Fi

LRT™

A video and audio delivery protocol, developed by LiveU. LRT™ uses **Dynamic network awareness** and other techniques to ensure rock-solid reliability over cellular and other IP networks.

LU2000 – Bonded Video Receiver

Receive, decode and playout any bonded video stream sent by LiveU's range of field units

- Can receive up to 4 simultaneous feeds
- Supporting multiple output formats:
 - Available in 3 SDI output configurations: 1, 2 or 4
 - SRT / RTSP / RTMP for IP streaming
 - MPEG-TS
 - NDI
 - Matrix
- 1U rack-mountable server
- High reliability with LRT™
- H.264 and HEVC decoding
- Full management and control via LiveU Central

LiveU DataBridge

Resilient high-speed mobile internet connectivity in any location

A powerful WiFi hotspot or Ethernet-based internet connectivity to any device:

- Laptops
- Phones
- Tablets

DataBridge bonds multiple networks

- 4G/5G cellular
- WiFi
- Ethernet

Video Return **via Link**

Give ad-hoc access to forces joining the operation

inv_99_grp_0_videofleet_1_VideoReturnInstance1 - Feed Sharing

Operational Field Exercise: Minoas 2024, Crete

The mission:

The **Ministry of Climate Crisis & Civil Protection**, the **Earthquake Planning & Protection Organization**, and the **Region of Crete** joined forces to improve coordination of services, the information gathering and evaluation processes and to train involved agencies/volunteers in case of earthquakes

The challenge:

Live signals from multiple locations in the field had to be delivered in real-time and with minimal delay to a HELLAS SAT vans on site from where the signal was distributed to

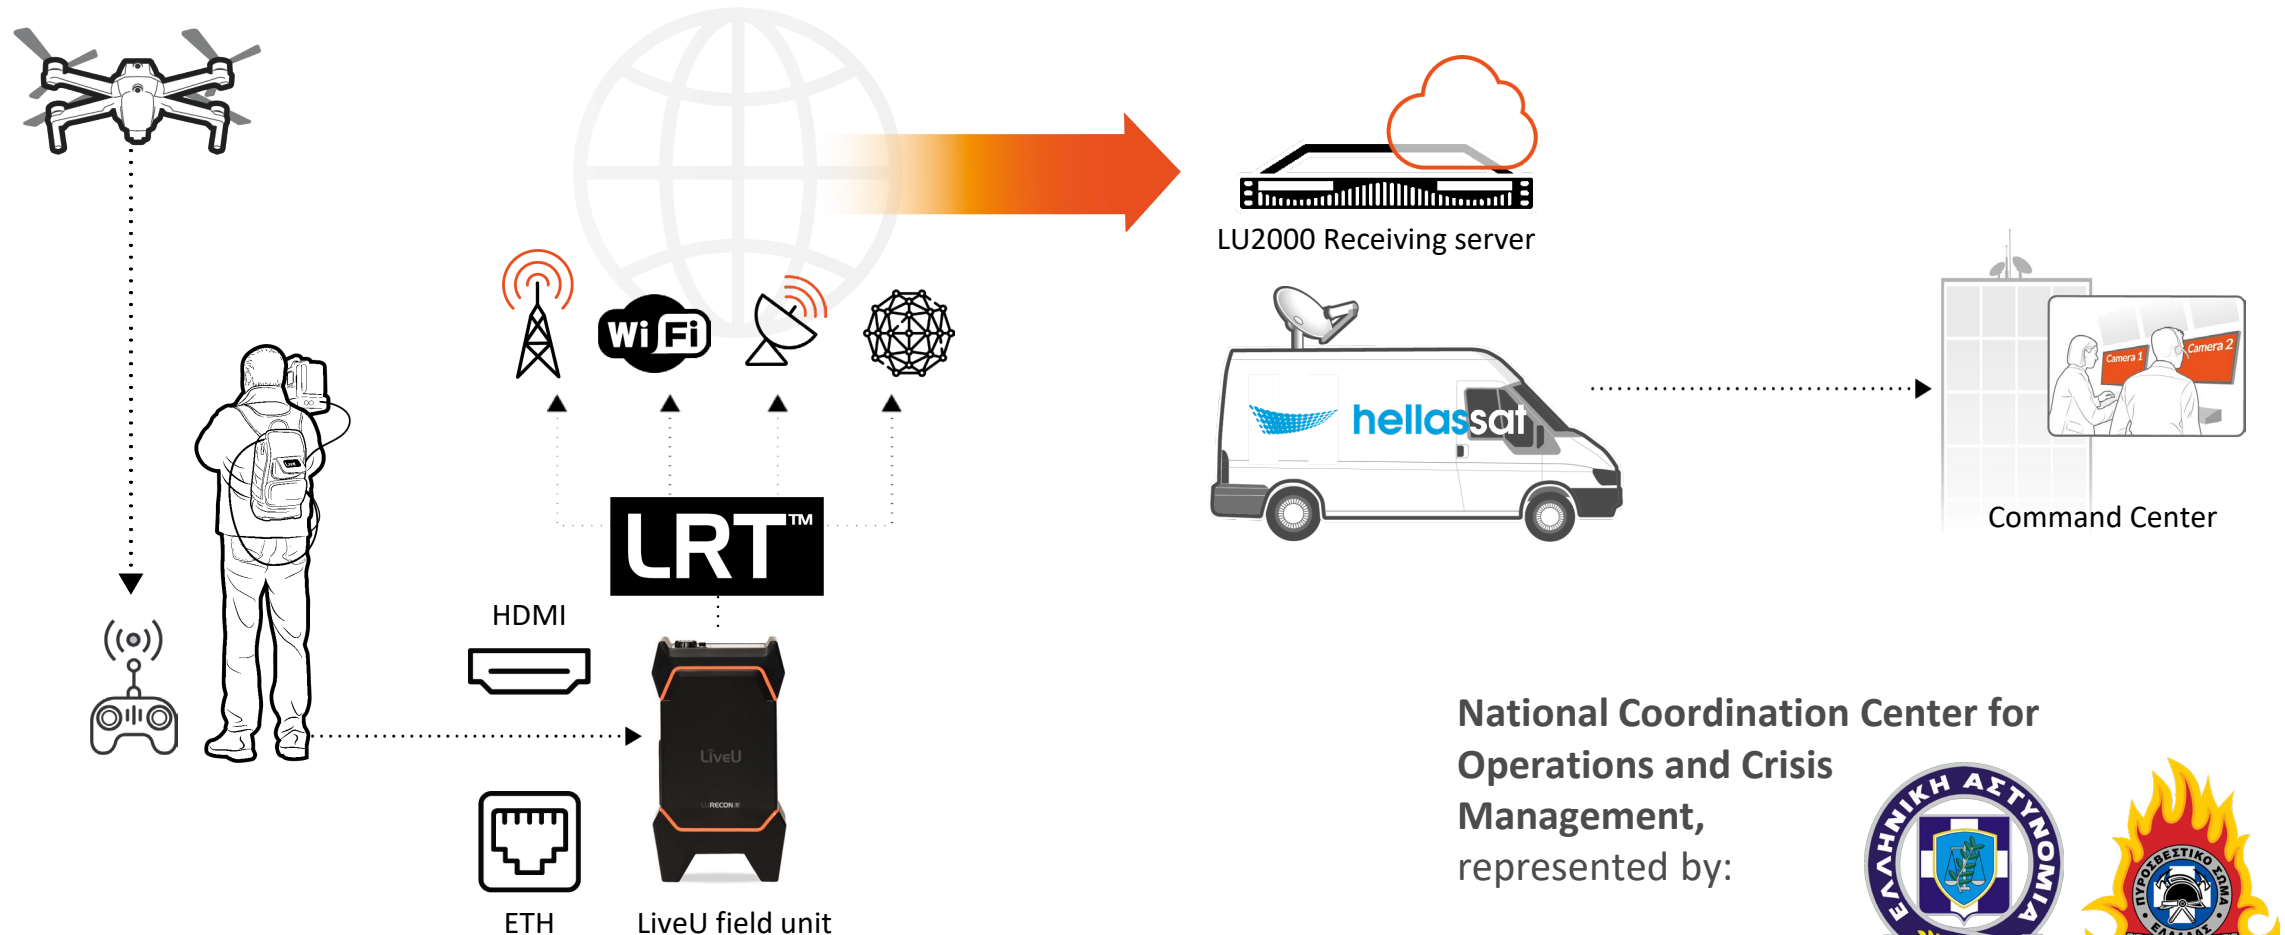

The solution:

The exercise was captured by ground-based cameras as well as drones which were connected to **LiveU field encoders** which transmitted the live signals using multiple bonded internet connections.

All LiveU delivered feeds were received by the HELLAS SAT vans using the **LU2000 server**

Rescue Services Case Study: SÄRF Fire Safety, Sweden

The mission:

Providing emergency services in six municipalities, including 25 fire and ambulance services.

The challenge:

Real-time situational awareness, fire and accident prevention and training, strengthening decision-making, responsiveness and preparedness to deal with fires and accidents.

The solution:

LiveU's **compact LU300S field encoder**, deployed with a **DJI Mavic Pro drone** operator, to deliver live videos from the field to SÄRF's headquarters

Over 200 LU-Smart mobile apps supplied to SÄRF's rescue crews, most importantly for use by the fire truck operators on their personal smartphones.

Live feeds transmitted to the **LU2000 server in the HQ control room**, displayed on a large 70-inch screen with data from the live server transmitted out to the field.

Rescue Services Case Study: SÄRF Fire Safety, Sweden

Niklas Ignell
Fire Safety Manager
SÄRF

*“It’s often said one picture says more than 1,000 words. We’ve been using LiveU technology for several years and its **reliability, encryption and ease of use**, in particular, are critical advantages. We’re now using a complete solution where everyone on the team has the **LU-Smart** app; the **fire fighters can simply click two buttons** after unlocking their phones to get the video app working. The teams find it easy to use whether they’re technical or non-technical.”*

”

Search & Rescue Case Study: Pegasus Aviación

The mission:

Operation of aircraft in emergency environments – mainly forest fires – and the rescue of people on land and at sea

The challenge:

Optimizing the operations using on-board technology, requiring options that would provide **greater connectivity in environments with poor coverage**

The solution:

A large number of LiveU's LU300 **compact field units deployed in its helicopters** to enhance its imaging services in Chile and Spain

Controlled by Pegasus Aviación through **LiveU's cloud-based management system**, LiveU Central

Using **LiveU's DataBridge** technology to access high-speed internet while the aircraft are in flight

Search & Rescue Case Study: Pegasus Aviación

José Antonio Rodríguez
Head of Projects,
Planning and Support
Pegasus Aviación

*“This technology greatly enhances the information we can obtain from our operations, allowing us to **capture live video images from places where it was previously unfeasible**. These real-time images play an important role for our customers, **allowing emergency managers to make decisions with fresh information from the field**. LiveU is an important technological step forward for us and we are looking to expand its use in the other countries we serve through our fleet of over 130 aircraft.”*

”

Key Benefits

High-quality with no compromises

Reliable and resilient video transmission

Enhanced mobility for on-the-go operations

Broad visibility: Borderless video sharing and distribution

Continue using your existing **Video Management System (VMS)** & Customer Distribution Network (CDN)

360-degree Situational Awareness

Global **24/7 support**
